Part 18 Math 100 Fall '21

Coordinate Systems

The Idea: One reason we talk about bases of a vector space is so that we can impose a "coordinate system" on V. So if a basis, \mathcal{B} , has n elements, then V "acts" like \mathbb{R}^n . This

| coordinate system on v. so if a basis, z, has n elements, then v acts like in . The |
|--|
| means that given any vector in a vector space, we can give it coordinates as if the vector |
| was from \mathbb{R}^n . |
| |
