CSC 180-01 Intelligent Systems (Fall 2022)

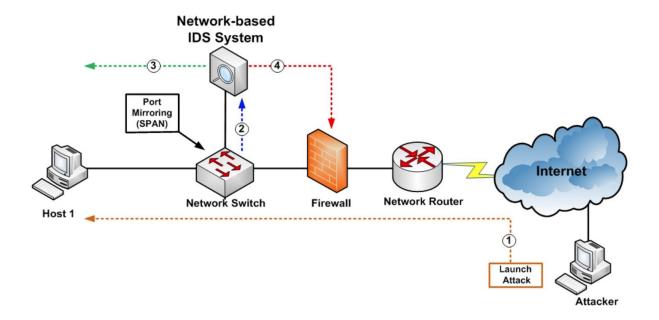

Project 2: Network Intrusion Detection System

Due at 10:00 am, Friday, October 14, 2022

Peer Review: class time, Friday, October 14, 2022

1. Problem Formulation

Software to detect network intrusions protects a computer network from unauthorized users, including perhaps insiders. This project aims to build an AI-based <u>Network Intrusion Detection System (IDS)</u>, a predictive model distinguishing between bad connections, called intrusions or attacks, and good normal connections.

<u>Model this problem as a BINARY classification problem.</u> Use the following models to <u>detect attack connections (intrusions)</u>. Compare <u>the recall, precision and F1-score</u> of the following models. PLOT the confusion matrix for each model.

- Fully-Connected Neural Networks
- Convolutional Neural Networks (CNN)

Hint: For CNN, <u>find a way to view each connection as an image</u>. Please refer to our lab tutorial on CNN for handling data types other than images. You may use either Conv2D or Conv1D.

2. Dataset

Download link:

https://drive.google.com/open?id=1FKyIqsKP4NBOTKRRuVbJjEFxTTCwzlHy

You can also find the complete data and the data description here (we use the 10% subset in this project) http://kdd.ics.uci.edu/databases/kddcup99/kddcup99.html

This database contains a wide variety of intrusions simulated in a military network environment.

- A connection is a sequence of TCP packets starting and ending at some well-defined times, between which data flows to and from a source IP address to a target IP address under some well-defined protocol.
- Each connection is labeled as either normal, or as one specific attack type.
- The datasets contain a total of 22 attack types, which are as follows:

back,buffer_overflow,ftp_write,guess_passwd,imap,ipsweep,land,loadmodule,multihop,neptune,nmap,normal,perl,phf,pod,portsweep,rootkit,satan,smurf,spy,teardrop,warezclient,warezmaster.

• Type of each feature in the dataset is as follows (see Appendix A for details):

duration: continuous. protocol type: symbolic. service: symbolic. flag: symbolic. src bytes: continuous. dst_bytes: continuous. land: symbolic. wrong fragment: continuous. urgent: continuous. hot: continuous. num failed logins: continuous. logged in: symbolic. num compromised: continuous. root shell: continuous. su attempted: continuous. num root: continuous. num_file_creations: continuous. num shells: continuous. num_access_files: continuous. num_outbound_cmds: continuous. is host login: symbolic. is guest login: symbolic. count: continuous.

srv_count: continuous.

serror rate: continuous. srv_serror_rate: continuous. rerror rate: continuous. srv_rerror_rate: continuous. same_srv_rate: continuous. diff srv rate: continuous. srv diff host rate: continuous. dst host count: continuous. dst_host_srv_count: continuous. dst_host_same_srv_rate: continuous. dst host diff srv rate: continuous. dst_host_same_src_port_rate: continuous. dst_host_srv_diff_host_rate: continuous. dst host serror rate: continuous. dst host srv serror rate: continuous. dst host rerror rate: continuous. dst_host_srv_rerror_rate: continuous

3. Data Preprocessing

For data preprocessing, you first need <u>encode good connections as "0" and attacks as "1"</u>. To achieve this, you have two options:

(1) Label encoding

https://scikit-learn.org/stable/modules/generated/sklearn.preprocessing.LabelEncoder.html

(2) Write your own Python encoding function and applying that function to the label column. Check the map() function discussed in this tutorial:

https://chrisalbon.com/code/python/data wrangling/pandas apply operations to dataframes/

4. Requirements

- Split data to training and test. Use training data to train your models and evaluate the model quality using test data
- Drop all the redundant records. This data set has **a big number of redundant records**. Redundant records in the train set will cause learning algorithms to be biased towards the more frequent records.
- Removing all records with missing values.
- Encode categorical features and normalize numeric features.

- Some column(s) may have missing values if you normalize raw values by dividing them using column max column min. Why? Remove those columns before model training.
- You must use EarlyStopping when training neural networks using Tensorflow.
- Tuning the following hyperparameters when training neural networks using Tensorflow to record how they affect performance in your report. Save all the models you have tried as a proof in your notebook and tabulate your findings in your report.

Activation: relu, sigmoid, tanh
Layers and neuron counts
Optimizer: adam and sgd

• Kernel number and kernel size (for CNN only)

5. Grading breakdown

You may feel this project is described with <u>some certain degree of vagueness</u>, which is left on purpose. In other words, **creativity is strongly encouraged**. Your grade for this project will be based on the soundness of your design, the novelty of your work, and the effort you put into the project.

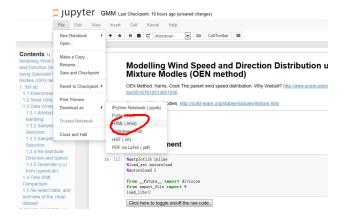

Use the evaluation form on Canvas as a checklist to make sure your work meet all the requirements.

6. Teaming:

Students must work in teams with no more than 3 people. Think clearly about who will do what on the project. Normally people in the same group will receive the same grade. However, the instructor reserve the right to assign different grades to team members depending on their contributions. So you should choose partner carefully! You are also welcome to work on your own.

7. Deliverables:

(1) The HTML version of your notebook that includes all your source code. Go to "File" and then "Download as". Click "HTML" to convert the notebook to HTML.

5 pts will be deducted for the incorrect file format.

- (2) Your report in PDF format, with your name, your id, course title, assignment id, and due date on the first page. As for length, I would expect a report with more than one page. Your report should include the following sections (but not limited to):
 - Problem Statement
 - Methodology
 - Experimental Results and Analysis
 - Task Division and Project Reflection

In the section "Task Division and Project Reflection", describe the following:

- who is responsible for which part,
- challenges your group encountered and how you solved them
- and what you have learned from the project as a team.

10 pts will be deducted for missing the section of task division and project reflection.

To submit your notebook and the report, go to Canvas "Assignments" and use "Project X (submit your code and report here)". Use the <u>evaluation form on Canvas</u> as a checklist to make sure your work meet all the requirements.

- (3) Link to your video presentation shared to the discussion board. Each team have three minutes to demo your work. Failure to submit the video presentation will result in zero point for the project. The following is how you should allocate your time:
 - Model/code design (1 minute)
 - Findings/results (1 minute)
 - Task division, challenges encountered, and what you learned from the project (1 minutes)

To submit the link to your video presentation, go to Canvas "Discussions" and use "Post Your Presentation for Project X Here". Share your link by replying directly to my main discussion post.

All the deliverables must be submitted by team leader on Canvas before

10:00 am, Friday, October 14, 2022

NO late submissions will be accepted.

8. Peer Review:

During the class after the deadline, please review and comment on the presentations from other teams by replying to their posts. It is a great chance for you to learn from other people's work. Please be nice, and provide constructive, specific feedbacks. You will become a better, more effective learner when you found yourself in a community of active learners!

9. Hints

• The provided CSV file has no column headers. So you may want to add column names using the following code when you load data into dataframe using pd.read_csv():

```
df.columns = [
  'duration',
  'protocol_type',
  'service',
  'flag',
  'src_bytes',
  'dst_bytes',
  'land',
  'wrong_fragment',
  'urgent',
  'hot',
  'num_failed_logins',
  'logged_in',
  'num_compromised',
  'root_shell',
```

```
'su attempted',
  'num root',
  'num file creations',
  'num shells',
  'num access files',
  'num outbound cmds',
  'is host login',
  'is guest login',
  'count'.
  'srv count',
  'serror rate',
  'srv serror rate',
  'rerror rate',
  'srv rerror rate',
  'same srv rate',
  'diff srv rate',
  'srv diff host rate',
  'dst host count',
  'dst host srv count',
  'dst host same srv rate',
  'dst host diff srv rate',
  'dst host same src port rate',
  'dst host srv diff host rate',
  'dst host serror rate',
  'dst host srv serror rate',
  'dst host rerror rate',
  'dst host srv rerror rate',
  'outcome'
1
```

10. Think beyond the Project

- Read this published paper based on the exact dataset used in the project. https://www.ee.ryerson.ca/~bagheri/papers/cisda.pdf
- Can you model this intrusion detection problem as a multi-class classification problem so that we can detect the specific attack type for each connection? How good such predictive model can be in this case?
- Among all the features, can you **identify the most important features** (this is so called feature importance analysis) and train models only on those most important features, e.g., top-10 most important features? What are the benefits to do that?

Hint: Refer to our lab 10 (regularization).

- Can you apply downsampling or oversampling to create a more balanced dataset to train your model so that you model will not be biased to those more frequent classes/attack types?
- A grander challenge dataset for you to play with about IoT applications
 https://www.unsw.adfa.edu.au/unsw-canberra-cyber/cybersecurity/ADFA-NB15-Datasets/bot_iot.php

Appendix A

A complete description of the features is given in the three tables below.

http://kdd.ics.uci.edu/databases/kddcup99/task.html

feature name	description	type
duration	length (number of seconds) of the connection	continuous
protocol_type	type of the protocol, e.g. tcp, udp, etc.	discrete
service	network service on the destination, e.g., http, telnet, etc.	discrete
src_bytes	number of data bytes from source to destination	continuous
dst_bytes	number of data bytes from destination to source	continuous
flag	normal or error status of the connection	discrete
land	I if connection is from/to the same host/port; 0 otherwise	discrete
wrong_fragment	number of ``wrong" fragments	continuous
urgent	number of urgent packets	continuous

Table 1: Basic features of individual TCP connections.

feature name	description	type
hot	number of ``hot" indicators	continuous
num_failed_logins	number of failed login attempts	continuous
logged_in	1 if successfully logged in; 0 otherwise	discrete
num_compromised	number of ``compromised" conditions	continuous
root_shell	1 if root shell is obtained; 0 otherwise	discrete
su_attempted	1 if ``su root" command attempted; 0 otherwise	discrete
num_root	number of ``root" accesses	continuous
num_file_creations	number of file creation operations	continuous
num_shells	number of shell prompts	continuous
num_access_files	number of operations on access control files	continuous
num_outbound_cmds	number of outbound commands in an ftp session	continuous
is_hot_login	1 if the login belongs to the ``hot" list; 0 otherwise	discrete
is_guest_login	1 if the login is a ``guest"login; 0 otherwise	discrete

Table 2: Content features within a connection suggested by domain knowledge.

feature name	description	type
count	number of connections to the same host as the current connection in the past two seconds	continuous
	Note: The following features refer to these same-host connections.	
serror_rate	% of connections that have ``SYN" errors	continuous
rerror_rate	% of connections that have ``REJ" errors	continuous
same_srv_rate	% of connections to the same service	continuous
diff_srv_rate	% of connections to different services	continuous
srv_count	number of connections to the same service as the current connection in the past two seconds	continuous
	Note: The following features refer to these same-service connections.	
srv_serror_rate	% of connections that have ``SYN" errors	continuous
srv_rerror_rate	% of connections that have ``REJ" errors	continuous
srv_diff_host_rate	% of connections to different hosts	continuous

Table 3: Traffic features computed using a two-second time window.
