Team Big Data Energy
Sprint 09 Retrospective

1) <u>Inspect how this Sprint went with regards to people, relationships, process, and tools</u>

This sprint was successful in terms of communication and smooth completion of all assigned tasks, team members were able to complete tasks early to allow time for a final code review before finalizing the project code. We were able to finalize the project with no errors and the client is satisfied with the product.

2) <u>Identify and order the major items that went well and potential improvements</u>

We were able to finish all coding tasks and meet all requirements.

Most tasks were done two or so days earlier, which was great and allowed the final task dependent on all the others to finalize everything without conflicts.

3) <u>Create a plan for implementing improvements to the way your team does its work</u>

We need to schedule meetings to get the rest of the project documents done and collaboratively work on the documents. We plan on what we need to write with the advice given from our lab meeting and examples on Canvas. We will assign different people to write different parts of the documents and then go together as a group to review and finalize the documents.

We don't have any more code to work on so we will focus on just writing the documents.
